**Case 8** − **Determination Of Nominal Strength (***P***n)**  For Given Eccentricity  $(e < e_b)$ 

In this case, eccentricity (*e*) is known and the corresponding failure load  $(P_n)$  is to be calculated.

For smaller eccentricities, the failure will be by crushing of concrete in compression and the strength reduction factor  $(\phi)$  will be 0.65 for tied columns.

 $e < e_b$   $\Rightarrow$   $P_n > P_{nb}$   $\Rightarrow$  compression failure **A-Exact Solution**

Assume that the compression steel is yielding.

**Step 1:** The tension steel stress  $f_s$  is evaluated in terms of '*a*' from the strain diagram.

$$
f_{\rm s} = 600 \frac{\beta_1 d - a}{a}
$$

**Step 2:** The above value of  $f_s$  is used in the expression for load and  $P_n$  is found in terms of '*a*'.

$$
P_{\rm n} = 0.85 f_{\rm c}' b a - 0.85 f_{\rm c}' A_{\rm s}' + A_{\rm s}' f_{\rm y} - A_{\rm s} f_{\rm s}
$$

*Step 3:* The value of  $P_n$  from Step-2 is inserted in the expression for moment to get a cubic equation in terms of '*a*'.

 $P_{\rm n} \times e =$  $\times$  e=  $[0.85 f_c' b a - 0.85 f_c' A_s'] (d - d'' - a/2)$  $+ A<sub>s</sub>' f<sub>y</sub> (d-d''-d') + A<sub>s</sub> f<sub>s</sub> (d'')$ 

The resulting cubic equation is solved as under:

i) Simplify the equation such that the right side of equation becomes equal to zero and a polynomial is obtained on the left side.

$$
F(a) = 0
$$

ii) The derivative of the left side polynomial with respect to '*a*' is evaluated.

$$
F'(a) = \frac{d}{da} F(a)
$$

iii) Trials are made as under until the value of the answer becomes stable.

$$
a_{n+1} = a_n - \frac{F(a_n)}{F'(a_n)}
$$

1<sup>st</sup> Trial: Assume  $a_0 = h/2$  and calculate  $F(a_0)$  and  $F'(a_0)$ . 2<sup>nd</sup> Trial: *n* = 1, revised value of '*a*' =  $a_1 = a_0 - \frac{F(a_0)}{F'(a_0)}$  $\left( a_{_{o}}\right)$ *o*  $F'(a)$ *F a* ′ Calculate  $F(a_1)$  and  $F'(a_1)$ .

The above procedure is repeated until convergence is obtained for the value of '*a*'.

*Step 4:* The yielding of compression steel is checked as under:

$$
\varepsilon'_{s} = 0.003 \frac{a - \beta_1 d'}{a}
$$
\n
$$
f'_{s} = 600 \frac{a - \beta_1 d'}{a} \leq f_{y}
$$

If the compression steel is not yielding, an expression for  $f'_{s}$  is formulated in terms of '*a*' and this value of  $f'_{s}$  is used in Steps 1 and 2 to get a new 3rd order equation in terms of '*a*'.

This equation is again solved by the procedure of Step-3 to get the correct value of '*a*'.

**Step 5:** Calculate  $f_s$  from the equation in Step-1.

*Step 6:* Calculate the nominal load from the load equation.

$$
P_{\rm n} = 0.85 f_{\rm c}' b a - 0.85 f_{\rm c}' A_{\rm s}' + A_{\rm s}' f_{\rm s}' - A_{\rm s} f_{\rm s}
$$

### **B-Trial Method**

This method is not preferable because of very slow convergence of the solution. In some cases, the answer for '*a*' may even oscillate requiring a large number of trials.

*Step 1:* In the start, the value of '*a*' is assumed greater than *h*/2.

*Step 2:* The tension steel stress is calculated as follows:

$$
f_{\rm s} = 600 \frac{\beta_{\rm l} d - a}{a}
$$

*Step* 3: The value of  $P_n$  is calculated from the moment equation.

$$
P_{\rm n} \times e = [0.85 f_{\rm c}' b a - 0.85 f_{\rm c}' A_{\rm s}'](d - d'' - a/2)
$$
  
+ A'\_{\rm s} f\_{\rm y} (d - d'' - d') + A\_{\rm s} f\_{\rm s} (d'')

- *Step 4:* By using the value of  $P_n$  calculated in Step-3, a new value of '*a*' is calculated from the load equation.
- *Step 5:* The steps 2 to 4 are repeated until  $P_n$ becomes nearly constant.

**Case 9** − **Determination Of Nominal Strength (***P***n) For**  Given Moment  $(P_n \leq P_{nb})$ 

The moment  $M<sub>n</sub>$  is given and it is known that the failure is by yielding of tension steel. Load  $P_n$  is to be found out and the strength reduction factor ( $\phi$ ) will be 0.65 to 0.9 for tied columns.

 $f<sub>s</sub> = f<sub>y</sub>$ Assume that the compression steel is yielding, *f* s ′ $' = f_{y}$ .

*Step 1:* Calculate '*a*' from the moment equation.

 $M_{\rm n}$  $=$   $[0.85 f_c' b a - 0.85 f_c' A_s'](d - d'' - a/2)$  $+ A<sub>s</sub>' f<sub>y</sub> (d-d''-d') + A<sub>s</sub> f<sub>y</sub> (d'')$ 

*Step 2:* The yielding of compression steel is checked as under:

$$
\frac{\varepsilon_{\rm s}^{\prime}}{\varepsilon_{\rm s}^{\prime}} = 0.003 \frac{a - \beta_{\rm l} d^{\prime}}{a}
$$
\n
$$
f_{\rm s}^{\prime} = 600 \frac{a - \beta_{\rm l} d^{\prime}}{a} \leq f_{\rm y}
$$

 $P_{\rm n}$ 

If the compression steel is not yielding, an expression for  $f_s'$  is formulated in terms of '*a*' and this value of  $f_s'$  is used in Steps 1. This equation is solved to get the correct value of '*a*'.

*Step 3:* Calculate the nominal load from the load equation.

 $=$  0.85  $f_c$ ' ba – 0.85  $f_c$ ' A<sub>s</sub>' + A<sub>s</sub>'  $f_s$ ' – A<sub>s</sub> $f_y$ 

#### *Step 4:* Calculate  $\varepsilon$  and hence evaluate the value of  $\phi$ .

## **Case 10** − **Determination Of Nominal Strength (***P***n) For Given Moment**  $(P_n > P_{nb})$

The moment  $M<sub>n</sub>$  is given and it is known that the compression failure will occur by crushing of concrete. Load  $P_n$  is to be found out and the strength reduction factor  $(\phi)$  will be 0.65 for tied columns.

 $f_{\rm s} < f_{\rm y}$ Assume that the compression steel is yielding, *f* s  $' = f_{y}$ .

*Step 1:* Find out  $f_s$  in terms of '*a*'.

$$
f_{\rm s} = 600 \frac{\beta_{\rm l} d - a}{a}
$$

*Step 2:* Calculate '*a*' from the moment equation.

$$
M_{\rm n} = \left[0.85\,f_{\rm c}'\,ba - 0.85\,f_{\rm c}'A_{\rm s}'\right](d - d'' - a/2) + A_{\rm s}'\,f_{\rm y}\,(d - d'' - d') + A_{\rm s}\,600\frac{\beta_{\rm 1}d - a}{a}\,(d'')
$$

**Step 3:** The yielding of compression steel is checked as under:

$$
\varepsilon_{\rm s}^{\prime} = 0.003 \frac{a - \beta_1 d^{\prime}}{a}
$$

$$
f'_{s} = 600 \frac{a - \beta_1 d'}{a} \leq f_{y}
$$

If the compression steel is not yielding, an expression for  $f_s'$  is formulated in terms of '*a*' and the value of '*a*' is again calculated.

- **Step 4:** Calculate  $f_s$  and  $f'_s$  (if compression steel is not yielding).
- **Step 5:** Calculate the nominal load from the load equation.

*Step 6:* For compression failure,  $\phi = 0.65$ .

**Case 11** − **Position Of N.A. (***c* **– Value) Is Given**

When the value of depth of neutral axis (*c*) is known, the analysis becomes straightforward.

Both tension and compression steel stresses can easily be found.

The collapse load is then calculated from the load equation and collapse moment from the moment equation.

This case is always used to plot interaction diagrams.

A number of different values of '*c*' may be assumed between 0 and *h*, and the corresponding points are plotted to get the required curve.

*Step 1:* Calculate the value of '*a*' from the given value of '*c*'.

**Step 2:** The tension and compression steel stresses along with the tension steel strain are calculated as follows:

$$
f_s = 600 \frac{\beta_1 d - a}{a} \le f_y
$$
  

$$
f'_s = 600 \frac{a - \beta_1 d'}{a} \le f_y
$$
  

$$
\varepsilon_s = 0.003 \frac{\beta_1 d - a}{a}
$$

*Step 3:* Calculate φ factor based on the tension steel strain.

*Step 4:* Calculate the nominal load from the load equation.

$$
P_{\rm n} = 0.85 f_{\rm c}' b a - 0.85 f_{\rm c}' A_{\rm s}' + A_{\rm s}' f_{\rm s}' - A_{\rm s} f_{\rm s}
$$

*Step* 5: The value of moment capacity  $M_n$  is calculated from the moment equation.

$$
M_{\rm n} = P_{\rm n} \times e = [0.85 f_{\rm c}' b a - 0.85 f_{\rm c}' A_{\rm s}] (d - d'' - a/2)
$$
  
+ A\_{\rm s}' f\_{\rm s}' (d - d'' - d') + A\_{\rm s} f\_{\rm s} (d'')

**Example 14.1:** A reinforced concrete short column has a cross-sectional size of  $450 \times 300$  mm and is loaded as shown in Fig. 14.13. It is reinforced by 6 bars of Grade 300, each having an area of 510 mm<sup>2</sup>.  $f_c$  $\prime$  = 25 *MPa* and  $f_y$ = 300 *MPa.* Analyze the column for the following conditions:  $\bigodot P_n$ 

- 1) Pure axial load 2) Balanced condition
- 3)  $P_{\rm u} = 1300 \text{ kN}$
- 4) *e* = 300 mm

Fig. 14.13.Column Cross-Section For Example 14.1.

### **Solution:**

*Location Of Plastic Centroid:* By symmetry, the plastic centroid of the given section coincides with the geometric centroid.

*1- Pure Axial Load (e=0)*

$$
P_{\text{no}} = 0.85 f_{\text{c}}' A_{\text{g}} + A_{\text{st}} (f_{\text{y}} - 0.85 f_{\text{c}}')
$$
  
= [0.85 (25)(300×450)  
+ 6(510)(300-0.85×25)] / 1000  
= 3721.7 kN

Fig. 14.14. Strain and Stress Diagrams For Case-2.

$$
\varepsilon_{y}
$$
 = 300 / 200,000 = 0.0015  
\n $c_{b}$  =  $\frac{600}{600 + f_{y}}$  d =  $\frac{600}{900}$  (375) = 250 mm  
\n $a_{b}$  =  $\beta_{1} c_{b}$  = 0.85 (250) = 212.5 mm  
\n $\varepsilon_{s}'$  =  $\frac{c_{b} - 75}{c_{b}}$  (0.003) = 0.0021 >  $\varepsilon_{y}$ 

(Compression steel is yielding)

#### **Internal forces**

$$
C_{\rm c} = 0.85 f_{\rm c}' a_{\rm b} b = 0.85 (25) (212.5) (300) / 1000
$$
  
= 1354.7 kN

$$
C'_{s'} = 3 A_{b} (f_{y} - 0.85 f_{c}')
$$
  
= 3 (510) (300 – 0.85×25) / 1000  
= 426.5 kN  

$$
T = 3 A_{b} f_{v} = 3(510) (300) / 1000
$$

$$
= 459.0 \text{ kN}
$$

$$
\therefore P_{\text{nb}} = C_{\text{c}} + C_{\text{s}}' - T
$$
  
= 1354.7 + 426.5 - 459.0 = 1322.2 kN  

$$
M_{\text{nb}} = \Sigma M_{\text{PC}} \qquad (225 - 12) + C1 (150) + T (150)
$$

$$
= C_{\rm c} (225 - a_{\rm b}/2) + C_{\rm s}' (150) + T (150)
$$

$$
= (1354.7)(0.119) + (426.5)(0.15) + (459.0)(0.15)
$$

 $= 294.0 \text{ kN-m}$ 

$$
e_{\rm b} = M_{\rm nb}/P_{\rm nb} = 222 \text{ mm}
$$

*a*

# *3- Pu* **= 1300 kN**

 $P_{\text{n}}$  =  $P_{\text{u}}$  /  $\phi$  = 1300 / 0.65 = 2000 kN (The strength reduction factor  $(\phi)$  is 0.65 for a tied column in case of compression failure)

$$
P_n > P_{nb} \Rightarrow \text{compression failure is confirmed}
$$
\n
$$
\therefore f_s < f_y
$$
\n
$$
\text{Assume } f'_s = f_y
$$
\n
$$
\text{Step 1:}
$$
\n
$$
f_s = 600 \frac{\beta_1 d - a}{a} = 600 \frac{0.85 \times 375 - a}{a}
$$

*a*

*Step 2:*

$$
P_n = 0.85 f_c' b a + A_s' (f_y - 0.85 f_c') - A_s f_s
$$

 $2,000,000 = (0.85)(25)(300)(a) + (1530)(278.75)$ 

$$
- 1530 \times 600 \frac{0.85 \times 375 - a}{a}
$$

2000  $a = 6.375 a^2 + 426.488 a - 292612.5 + 918 a$  $a^2 - 102.83 a - 45900 = 0$ 

 $a = 271.74 \text{ mm}$ 

 $c = 271.74 / 0.85 = 319.7$  mm < *d* (OK)

*Step 3:*

$$
f'_{s} = 600 \frac{a - \beta_{1}d'}{a}
$$
  
= 600 \frac{271.74 - 0.85 \times 75}{271.74}  
= 459.2 MPa > f<sub>y</sub>  

$$
\therefore
$$
 The compression steel is yielding.  
**Step 4:**  

$$
f_{s} = 600 \frac{0.85 \times 375 - a}{a}
$$
  
= 600 \frac{0.85 \times 375 - 271.74}{271.74} = 103.80 MPa

#### *Step 5:*

 $M_{\rm n}$ 

$$
A_n = 0.85 f_c' b a (d - d'' - a/2)
$$
  
+ A<sub>s</sub>' (f<sub>y</sub> - 0.85 f<sub>c</sub>') (d - d'' - d') + A<sub>s</sub> f<sub>s</sub> (d'')  
= [(0.85)(25)(300)(271.74)(375 – 150  
– 271.74/2) + (1530)( 278.75)(375 – 150  
– 75) + (1530)(103.80)(150)] / 10<sup>6</sup>  
= 242.20 kN-m

*4- e* **= 300 mm**

 $e > e_b$  means  $P_n < P_{nb}$  $\implies$  tension failure  $\therefore$  *f<sub>s</sub>* = *f<sub>y</sub>* Assume  $f'_{s'} = f_{y}$  (to be checked later)

- *Step 1:* The nominal load capacity  $P_n$  is calculated in terms of '*a*' as follows:
- *P*n  $=$  0.85  $f'_c$  ba +  $A'_s$ '( $f_y$  – 0.85  $f'_c$ ) –  $A_s f_y$  $(0.85)(25)(300)(a) + (1530)(278.75)$ − (1530)(300) = 6375 *a* − 32513
- *Step 2:* The value of  $P_n$  is used in the expression for moment and the value of '*a*' is calculated by solving the resulting equation in terms of '*a*'.

$$
P_{\rm n} \times e = 0.85 f_{\rm c}' b a (d - d'' - a/2) + A_{\rm s}'(f_{\rm y} - 0.85 f_{\rm c}') (d - d'' - d') + A_{\rm s} f_{\rm y} d''
$$

 $(6375 a - 32513)(300) = (6375)(a)[375 - 150 - a/2]$  $+ (1530)(278.75)[375 - 150]$  $-75$ ] + (1530)(300)(150)

 $a^2 + 150 a - 44730 = 0$  *a* = 149.4 mm

*Step 3:*  $\varepsilon_{\rm s}^{\prime}$  = 0.003 *a*  $a - \beta_1 d'$  $=$   $0.003 \frac{149.4 \frac{0.03 \times 13}{140.4}}{140.4} = 0.00172$  $> \varepsilon_{\rm v}$  *(OK)* 149.4 149.4−0.85× 75

## *Step 4:* Calculate load from the load equation.

$$
P_{\rm n} = 0.85 f_{\rm c}' b a + A_{\rm s}' f_{\rm y} - A_{\rm s} f_{\rm y}
$$

$$
= [ (6375)(149.4) + (1530)(278.75)
$$

- $-$  (1530)(300)] / 1000
- $=$  919.9 kN

$$
M_{\rm n} =
$$

$$
= P_n \times e
$$

 $=$  919.9  $\times$  300 / 1000 = 275.97 kN-m

*Step 5:*

$$
\varepsilon_{s} = 0.003 \frac{\beta_{1}d - a}{a}
$$
  
= 0.003 \frac{0.85 \times 375 - 149.4}{149.4} = 0.0034

$$
\phi = 0.65 + \frac{0.25}{0.005 - \varepsilon_y} (\varepsilon_t - \varepsilon_y)
$$
  
= 0.65 + \frac{0.25}{0.005 - 0.0015} (0.0034 - 0.0015) = 0.79

**Example 14.2:** A reinforced concrete short column has a cross-sectional size of  $450 \times 300$  mm and is loaded as shown in Fig. 14.15. It is reinforced by 6 bars of Grade 300, each having an area of 510 mm2. *f c* ′ $' = 25$  *MPa* and  $f_y = 300$ *MPa.* Construct an approximate P-M interaction diagram.

 $\bigodot P_n$ 

Fig. 14.15.Column Cross-Section For Example 14.2.

#### **Solution:**

*Location Of Plastic Centroid:* By symmetry, the plastic centroid of the given section coincides with the geometric centroid.

#### *Nominal Capacities:*

*1- Pure Axial Load (e=0)*

$$
P_{\text{no}} = 0.85 f_{\text{c}}' A_{\text{g}} + A_{\text{st}} (f_{\text{y}} - 0.85 f_{\text{c}}')
$$
  
= [0.85 (25)(300×450) + 6(510)(300  
-0.85×25)] / 1000  
= 3721.7 kN

 $\odot$   $P_{\rm n}$ 

Fig. 14.16. Strain and Stress Diagrams For Case-2.

$$
\varepsilon_{y}
$$
 = 300 / 200,000 = 0.0015  
\n $c_{b}$  =  $\frac{600}{600 + f_{y}}$  d =  $\frac{600}{900}$  (375)  
\n= 250 mm  $\frac{h}{2}$  = 225 mm

This means that the central layer of steel is in compression.

$$
a_{\text{b}} = \beta_1 c_{\text{b}} = 0.85 (250) = 212.5 \text{ mm}
$$

$$

$$

$$
\Sigma C = \Sigma T \implies
$$

 $612,000 \frac{c-75}{2} - 21,675 + 5419 c = 306,000 + 306,000$ *c c* − 75

 $612,000 \text{ } c - 45,900,000 - 21,675 \text{ } c + 5419 \text{ } c^2 = 612,000$ 

 $5419$   $c^2 - 21,675$   $c - 45,900,000 = 0$ 

*c* = 94.055 mm ∴ *N.A. lies in-between steel-1 and steel-2*

$$
\varepsilon_1 = \frac{c - 75}{c} (0.003) = 0.00061
$$
\n
$$
\varepsilon_2 = \frac{225 - c}{c} (0.003) = 0.00418
$$
\n
$$
\therefore \text{ Steel No. 2 is yielding}
$$

$$
C_{s1} = 102.314 kN
$$
  
\n
$$
C_{c} = 509.686 kN
$$
  
\n
$$
P_{n} = C_{s1} + C_{c} - T_{2} - T_{3}
$$
  
\n
$$
= 509.686 + 102.314 - 2 \times 306 = 0
$$
 (O.K.)  
\n
$$
M_{no} = C_{s1}(225-75)/1000 + C_{c} \left(225 - \frac{0.85 \times 94.055}{2}\right)
$$
  
\n
$$
/1000 + T_{2}(0) + T_{3}(150)/1000
$$
  
\n
$$
= 155.6 kN-m
$$

#### **Ultimate Capacities**

Case – I:  $\phi P_{\text{no}} = 0.65 (3721.7) = 2419 kN$ *(without additional factor of safety)*

$$
(0.80) \phi P_{\text{no}} = 1935 \text{ kN}
$$

Case – II: 
$$
\phi M_n = 0.65(249.8) = 162.4 \text{ kN-m}
$$
;  
 $\phi P_n = 0.65(1394.2) = 906 \text{ kN}$ 

Case – III: 
$$
\phi M_n = 0.90(214.6) = 193.1 \text{ kN-m}
$$
;  
\n $\phi P_n = 0.90(435.4) = 392 \text{ kN}$   
\nCase – VI:  $\phi M_n = 0.90(155.6) = 140.0 \text{ kN-m}$ ;

$$
\phi P_n = 0 \, kN
$$
\nThe approximate nominal and design interaction curves are obtained by plotting these points on scale such as in

are obtained by plotting these points on scale such as in Fig. 14.18.

Fig. 14.18. Approximate Interaction Curves For Example 14.2.

## **DESIGN OF RECTANGULAR SHORT COLUMNS HAVING UNIAXIAL ECCENTRICITY USING FORMULAS**

**Step 1:** First investigate the balanced condition.

 $A_{\rm s} = A_{\rm s}'$ Assume that the compression steel is yielding for the balanced condition  $(f_s' = f_y)$ .

Calculate  $a_{\rm h}$  and check for yielding of the compression steel.

$$
a_{b} = \beta_{1}d \frac{600}{600 + f_{y}}
$$
 (I)

$$
\varepsilon'_{s} = 0.003 \frac{a_{b} - \beta_{1}d'}{a_{b}}
$$
 (II)

- If  $\varepsilon_{s}' \geq \varepsilon_{y}$ , the compression steel will be yielding.
- **Step 2:** Calculate  $P_{nb} = 0.85 f_c' b a_b$  (If both steels are yielding and compression steel stress is assumed to be  $f_{v}$  in place of the actual value equal to  $f_{\rm y}$  – 0.85  $f_{\rm c}$ ')

$$
(P_{\text{ub}})_{\text{design}} = P_{\text{b}} = \phi P_{\text{nb}} = 0.65 \times 0.85 f_c' b a_b \quad (III)
$$

# **Case I:**  $P_u < P_b$  : Tension Failure

It is known that the tension steel is yielding,  $f_s = f_y$ .

**Step 3:** Find approximate value of 
$$
\phi
$$
.  
\n
$$
\phi = 0.9 - \frac{P_u}{4 P_{nb}}
$$
\n(VI)

**Step 4:** Assume the compression steel to be yielding and calculate '*a*' from the following equation.

$$
\frac{A_u}{\phi} = 0.85 f_c' b a \tag{V}
$$

 $$ 

**Step 5:** Check the yielding of compression steel.

$$
f'_{s} = 600 \frac{a - \beta_1 d'}{a}
$$
 (VI)

If  $f_s' \ge f_y$ , the compression steel is yielding  $\Rightarrow f_s' = f_y$ .

If  $f_s' < f_y$ , find '*a*' by using procedure of Case II.

**Step 6:** The value of  $\phi$  may be refined by using the following expressions:

$$
\varepsilon_{s} = 0.003 \frac{\beta_{1}d - a}{a}
$$
 (VII)  
\n
$$
\phi = 0.65 + \frac{0.25}{0.005 - \varepsilon_{y}} (\varepsilon_{t} - \varepsilon_{y})
$$
 (VIII)

Steps 4 and 5 may be revised in case the value of  $\phi$  is significantly different.

**Step 7:** Taking moments about the plastic centroid, calculate  $A_s$  and  $A_s'$ .

$$
\frac{P_u.e}{\phi} = 0.85 f_c' b a (d - d'' - a/2) + A_s' f_y (d - d'' - d') + A_s f_y d''
$$

For symmetrical sections having same steel and covers on both the sides,

$$
A_s = A'_s = h/2
$$
  
\n
$$
d - d'' = h/2
$$
  
\nand 
$$
d'' = h/2 - d'
$$

$$
\frac{P_u.e}{\phi} = 0.85 f_c' b a \left(\frac{h}{2} - \frac{a}{2}\right) + A_{st} f_y \left(\frac{h}{2} - d'\right)
$$
 (IX)

# **Case II:**  $P_u > P_b$  : Compression Failure

Exact calculations are lengthy for compression failure as compared with tension failure.

However, the compression steel will nearly always be yielding in such cases.

The factor  $\phi$  is always 0.65 for tied columns for compression failure.

**Step 3:** From the strain diagram, calculate  $f_s$  in terms of '*a*'.

$$
f_s = 600 \frac{\beta_1 d - a}{a} \tag{X}
$$

**Step 4:** Calculate  $A_{st}$  in terms of '*a*' from the load equation.

*p* 

$$
\frac{I_u}{\phi} = 0.85 f_c' b a + A_s' f_y - A_s f_s
$$
\n
$$
\frac{P_u}{\phi} = 0.85 f_c' b a + \frac{A_{st}}{2} f_y - \frac{A_{st}}{2} \times 600 \frac{\beta_1 d - a}{a}
$$

(XI)

$$
A_{\rm st} = f_1(a) \tag{XII}
$$

**Step 5:** Calculate  $A_{st}$  in terms of '*a*' from the moment equation.

$$
\frac{P_u \cdot e}{\phi} = 0.85 f_c' \, ba \left( \frac{h}{2} - a/2 \right) + \frac{A_{st}}{2} f_y \left( \frac{h}{2} - d' \right) \n+ \frac{A_{st}}{2} \, 600 \, \frac{\beta_1 d - a}{a} \left( \frac{h}{2} - d' \right) \qquad \text{(XIII)}
$$
\n
$$
A_{st} = f_2(a) \qquad \text{(XIV)}
$$

**Step 6:** Equate  $A_{st}$  calculated in steps 4 and 5 to form a cubic equation in terms of '*a*'. Solve this equation to calculate the value of  $\alpha'$ .

$$
f_1(a) = f_2(a)
$$

$$
C_2(a) \t\t (XV)
$$

# Step 7: Calculate  $A_{st}$  from Eq. XII or XIV.
